A-level BIOLOGY

Paper 1

Monday 12 June 2017

Afternoon

Time allowed: 2 hours

For this paper you must have:

- a ruler with millimetre measurements
- a calculator.

Instructions

- Use black ink or black ball-point pen.
- Fill in the boxes at the top of this page.
- Answer all questions.
- You must answer the questions in the spaces provided. Do not write outside the box around each page or on blank pages.
- All work must be shown.
- Do all rough work in this book. Cross through any work you do not want to be marked.

Information

- The marks for the questions are shown in brackets.
- The maximum mark for this paper is 91.

	Answer all questions in the spaces provided.
01.1	Give the two types of molecule from which a ribosome is made. [1 mark]
	Describe the role of a ribosome in the production of a polypeptide. Do not include transcription in your answer. [3 marks]

box

02	In mammals, in the early stages of pregnancy, a developing embryo exchanges substances with its mother via cells in the lining of the uterus. At this stage, there is a high concentration of glycogen in cells lining the uterus.
02.1	Describe the structure of glycogen. [2 marks]
02.2	During early pregnancy, the glycogen in the cells lining the uterus is an important energy source for the embryo.
	Suggest how glycogen acts as a source of energy. Do not include transport across membranes in your answer. [2 marks]

Do not write outside the box

		•	
٠	-		
-			

02.3	Suggest and explain two ways the cell-surface membranes of the cells lining the uterus may be adapted to allow rapid transport of nutrients.
	[2 marks]
	2
02.4	In humans, after the gametes join at fertilisation, every cell of the developing
	 embryo undergoes mitotic divisions before the embryo attaches to the uterus lining. The first cell division takes 24 hours. The subsequent divisions each take 8 hours.
	After 3 days, the embryo has a total volume of 4.2×10^{-3} mm ³ .
	What is the mean volume of each cell after 3 days? Express your answer in standard form.
	Show your working. [2 marks]
	Answer = mm ³
	Turn over ►

0 3 . 1

Sodium ions from salt (sodium chloride) are absorbed by cells lining the gut. Some of these cells have membranes with a carrier protein called NHE3.

NHE3 actively transports one sodium ion into the cell in exchange for one proton (hydrogen ion) out of the cell.

Use your knowledge of transport across cell membranes to suggest how NHE3 does this.

[3 marks]

03.2

Scientists investigated the use of a drug called Tenapanor to reduce salt absorption in the gut. Tenapanor inhibits the carrier protein, NHE3.

The scientists fed a diet containing a high concentration of salt to two groups of rats, \bf{A} and \bf{B} .

- The rats in Group **A** were **not** given Tenapanor (0 mg kg⁻¹).
- The rats in Group **B** were given 3 mg kg⁻¹ Tenapanor.

One hour after treatment, the scientists removed the gut contents of the rats and immediately weighed them.

Their results are shown in Table 2.

Table 2

Concentration of Tenapanor / mg kg ⁻¹	Mean mass of contents of the gut / g
0	2.0
3	4.1

The scientists carried out a statistical test to see whether the difference in the means was significant. They calculated a P value of less than 0.05.

They concluded that Tenapanor did reduce salt absorption in the gut.

Use all the information provided and your knowledge of water potential to explain how they reached this conclusion.

[4 marks]

0 7

Do not write outside the box

High absorption of salt from the diet can result in a higher than normal concentration of salt in the blood plasma entering capillaries. This can lead to a build-up of tissue fluid.

Explain how.

[2 marks]

because bacteria divide rapidly, producing a large number of them in a short time. Describe how bacteria divide. [2 marks] [2 marks] [3 marks] [4 marks] [5			10	Do not wri outside th box

Scientists investigated treatment of a human bladder infection caused by a species of bacterium. This species of bacterium is often resistant to the antibiotics currently used for treatment.	box
They investigated the use of a new antibiotic to treat the bladder infection. The new antibiotic inhibits the bacterial ATP synthase enzyme.	
Place a tick (\checkmark) in the appropriate box next to the equation which represents the reaction catalysed by ATP synthase. [1 mark]	
$ATP \longrightarrow ADP + P_i + H_2O$	
$ATP + H_2O \longrightarrow ADP + P_i$	
$ADP + P_i \longrightarrow ATP + H_2O$	
$ADP + P_i + H_2O \longrightarrow ATP$	
The new antibiotic is safe to use in humans because it does not inhibit the ATP synthase found in human cells.	

Suggest why human ATP synthase is not inhibited and bacterial synthase is inhibited.

05.5	The scientists suggested that people newly diagnosed with this bladder infection should be treated with both the current antibiotic and the new antibiotic.	
	Explain why the scientists made this suggestion.	
	Use information from Figure 2 and your knowledge of evolution of antibiotic resistance in bacteria in your answer.	
	[3 marks]	
		9

Scientists investigated the effect of 2,4-D on wheat plants (a crop) and on wild oat plants (a weed).

They grew plants of both species in glasshouses. They put plants of each species into one of two groups, W and H, which were treated as follows:

- Group W leaves sprayed with water
- Group H leaves sprayed with a solution of 2,4-D.

After spraying, they cut 40 discs from the leaves of plants in each group and placed them in flasks containing 10 cm³ de-ionised water. After 5 minutes, they calculated the disruption to cell-surface membranes by measuring the concentration of ions released into the water from the leaf discs.

Their results are shown in Table 3.

The lowest significant difference (LSD), is the smallest difference between two means that would be significant at P≤0.05

Group	Treatment	Mean concentration of ions in water / arbitrary units		
-		Wheat	Wild oats	
w	Water	26	45	
Н	2,4-D	27	70	
Lowest significant difference (LSD)		7	10

Collagen is a protein produced by cells in joints, such as the knee.

Rheumatoid arthritis (RA) is an auto-immune disease. In an auto-immune disease, a person's immune system attacks their own cells. RA causes pain, swelling and stiffness in the joints.

Scientists have found a virus that produces a protein very similar to human collagen.

Suggest how the immune response to this viral protein can result in the development of RA.

An environmental scientist investigated a possible relationship between air pollution and the size of seeds produced by one species of tree.

He was provided with a very large number of seeds collected from a population of trees in the centre of a city and also a very large number of seeds collected from a population of trees in the countryside.

Describe how he should collect and process data from these seeds to investigate whether there is a difference in seed size between these two populations of trees. [5 marks]
