## INSTRUCTIONS

- Use black ink or black ball-point pen.
- Answer ALL questions.
- You must answer the questions in the spaces provided.
- Do all rough work in this book. Cross through any work you do not want to be marked.

## INFORMATION

- The marks for questions are shown in brackets.
- The maximum mark for this paper is 75.

## ADVICE

- In some questions you may be required to indicate your answer by shading a lozenge. If you wish to change your answer, make sure that the incorrect answer is clearly crossed through with an x.

**DO NOT TURN OVER UNTIL TOLD TO DO SO**

**TABLE 2 – standard AQA assembly language instruction set**

LDR Rd, <memory ref>	Load the value stored in the memory location specified by <memory ref> into register d.
STR Rd, <memory ref>	Store the value that is in register d into the memory location specified by <memory ref>.
ADD Rd, Rn, <operand2>	Add the value specified in <operand2> to the value in register n and store the result in register d.
SUB Rd, Rn, <operand2>	Subtract the value specified by <operand2> from the value in register n and store the result in register d.
MOV Rd, <operand2>	Copy the value specified by <operand2> into register d.
CMP Rn, <operand2>	Compare the value stored in register n with the value specified by <operand2>.
B <label>	Always branch to the instruction at position <label> in the program.

<b>B&lt;condition&gt; &lt;label&gt;</b>	<b>Branch to the instruction at position &lt;label&gt; if the last comparison met the criterion specified by &lt;condition&gt;. Possible values for &lt;condition&gt; and their meanings are:</b>  <b>EQ: equal to            NE: not equal to</b> <b>GT: greater than        LT: less than</b>
<b>AND Rd, Rn, &lt;operand2&gt;</b>	<b>Perform a bitwise logical AND operation between the value in register n and the value specified by &lt;operand2&gt; and store the result in register d.</b>
<b>ORR Rd, Rn, &lt;operand2&gt;</b>	<b>Perform a bitwise logical OR operation between the value in register n and the value specified by &lt;operand2&gt; and store the result in register d.</b>
<b>EOR Rd, Rn, &lt;operand2&gt;</b>	<b>Perform a bitwise logical XOR (exclusive or) operation between the value in register n and the value specified by &lt;operand2&gt; and store the result in register d.</b>
<b>MVN Rd, &lt;operand2&gt;</b>	<b>Perform a bitwise logical NOT operation on the value specified by &lt;operand2&gt; and store the result in register d.</b>
<b>LSL Rd, Rn, &lt;operand2&gt;</b>	<b>Logically shift left the value stored in register n by the number of bits specified by &lt;operand2&gt; and store the result in register d.</b>

**[Turn over]**

LSR Rd, Rn, <operand2>	Logically shift right the value stored in register n by the number of bits specified by <operand2> and store the result in register d.
HALT	Stops the execution of the program.

**LABELS:** A label is placed in the code by writing an identifier followed by a colon (:). To refer to a label, the identifier of the label is placed after the branch instruction.

### Interpretation of <operand2>

<operand2> can be interpreted in two different ways, depending on whether the first character is a # or an R:

- # – Use the decimal value specified after the #, eg #25 means use the decimal value 25.
- R<sub>m</sub> – Use the value stored in register m, eg R6 means use the value stored in register 6.

The available general purpose registers that the programmer can use are numbered 0 to 12.

**BLANK PAGE**

**[Turn over]**

The **AND** instruction can be used to help identify if a particular bit in a register contains a 1. The instruction **AND R3, R1, #8** will perform the logical bitwise **AND** operation between the contents of register **R1** and the bit pattern **0000 1000** and store the result in register **R3**. If register **R1** has a 1 in bit 3 then the bit pattern for the decimal number 8 will be stored in register **R3**, otherwise the bit pattern for the decimal number 0 will be stored in register **R3**.

**FIGURE 2** and **FIGURE 3** show examples of this.

**FIGURE 2 – Example when bit 3 of R1 contains a 1**

Bit	7	6	5	4	3	2	1	0
R1	0	1	0	0	1	1	1	0

Result of

	0	1	0	0	1	1	1	0
AND	0	0	0	0	1	0	0	0

is

	0	0	0	0	1	0	0	0
--	---	---	---	---	---	---	---	---

So **R3** will now contain

	0	0	0	0	1	0	0	0
--	---	---	---	---	---	---	---	---

FIGURE 3 – Example when bit 3 of R1 contains a 0

Bit	7	6	5	4	3	2	1	0
R1	0	1	0	0	0	1	1	0

Result of

	0	1	0	0	0	1	1	0
AND	0	0	0	0	1	0	0	0

is

	0	0	0	0	0	0	0	0
--	---	---	---	---	---	---	---	---

So R3 will now contain

	0	0	0	0	0	0	0	0
--	---	---	---	---	---	---	---	---

- 04.2** All even numbers are represented by bit patterns ending with a 0; all odd numbers are represented by bit patterns ending with a 1.

FIGURE 4 shows a block of code, written in a high-level language, that is used to find out if the number stored in the variable  $A$  is even. If the value is even then the number  $69_{10}$  is stored in the variable  $B$ , otherwise the number  $79_{10}$  is stored in the variable  $B$ .

**FIGURE 4**

```
IF IsEven(A)

Write a sequence of assembly language instructions that would perform the same operations as the high-level language code in FIGURE 4.

Assume that register  $R1$  currently stores the value associated with  $A$ , that register  $R2$  stores the value currently associated with  $B$  and that register  $R3$  is available for general use, if necessary.
