Location Entry Codes

WWW strapapers.com As part of CIE's continual commitment to maintaining best practice in assessment, CIE uses different variants of some question papers for our most popular assessments with large and widespread candidature. The question papers are closely related and the relationships between them have been thoroughly established using our assessment expertise. All versions of the paper give assessment of equal standard.

The content assessed by the examination papers and the type of questions is unchanged.

This change means that for this component there are now two variant Question Papers, Mark Schemes and Principal Examiner's Reports where previously there was only one. For any individual country, it is intended that only one variant is used. This document contains both variants which will give all Centres access to even more past examination material than is usually the case.

The diagram shows the relationship between the Question Papers, Mark Schemes and Principal Examiners' Reports that are available.

Question Paper	Mark Scheme	Principal Examiner's Report
Introduction	Introduction	Introduction
First variant Question Paper	First variant Mark Scheme	First variant Principal Examiner's Report
Second variant Question Paper	Second variant Mark Scheme	Second variant Principal Examiner's Report

Who can I contact for further information on these changes? Please direct any questions about this to CIE's Customer Services team at: international@cie.org.uk

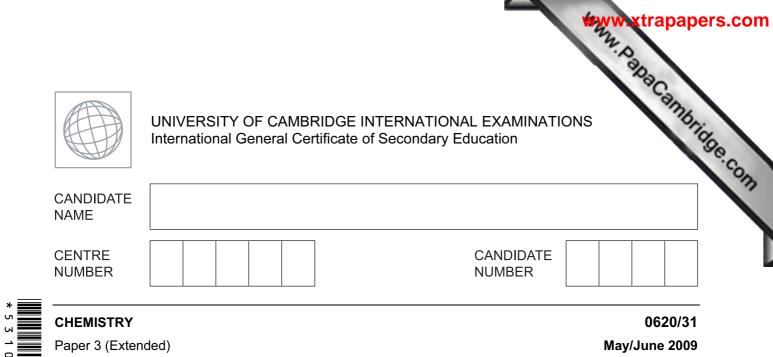

The titles for the variant items should correspond with the table above, so that at the top of the first page of the relevant part of the document and on the header, it has the words:

First variant Question Paper / Mark Scheme / Principal Examiner's Report ٠

or

Second variant Question Paper / Mark Scheme / Principal Examiner's Report ٠

as appropriate.

1 hour 15 minutes

Candidates answer on the Question Paper.

No Additional Materials are required.

READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name on all the work you hand in.

Write in dark blue or black pen.

You may use a pencil for any diagrams, graphs or rough working.

Do not use staples, paper clips, highlighters, glue or correction fluid. DO **NOT** WRITE IN ANY BARCODES.

Answer **all** questions. A copy of the Periodic Table is printed on page 16.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [] at the end of each question or part questions.

Www.papaCambridge.com 4 The reactivity series of metals given below contains both familiar and unfamiliar ele For most of the unfamiliar elements, which are marked *, their common oxidation states given.

* barium	Ва
* lanthanum	La (+3)
magnesium	
zinc	
* chromium	Cr (+2), (+3), (+6)
iron	
copper	
* palladium	(+2)

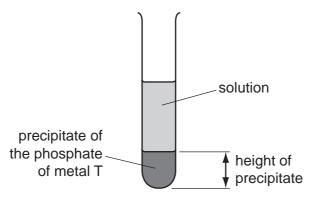

Choose metal(s) from the above list to answer the following questions.

(i) Which two metals would not react with dilute hydrochloric acid? [2] (ii) Which two unfamiliar metals (*) would react with cold water? [2] (iii) What is the oxidation state of barium? [1] (iv) Name an unfamiliar metal (*) whose oxide cannot be reduced by carbon. [1] (v) Why should you be able to predict that metals such as iron and chromium have more than one oxidation state? [1] [Total: 7]

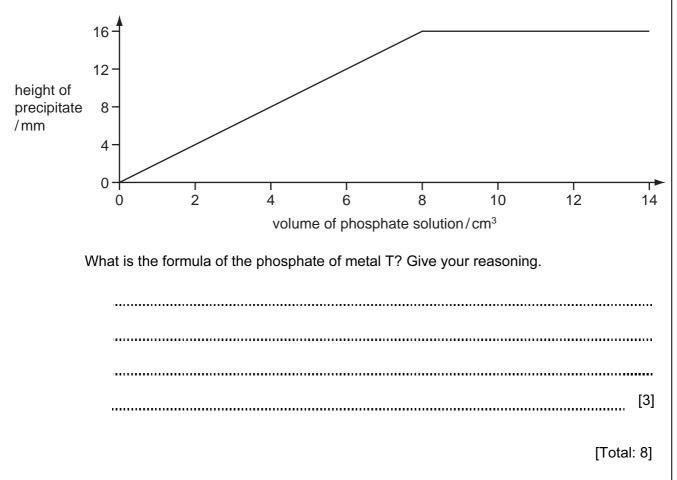

WANN, PapaCambridge.com 6 5 Insoluble salts are made by precipitation. (a) A preparation of the insoluble salt calcium fluoride is described below. To 15 cm³ of aqueous calcium chloride, 30 cm³ of aqueous sodium fluoride is added. The concentration of both solutions is $1.00 \text{ mol} / \text{dm}^3$. The mixture is filtered and the precipitate washed with distilled water. Finally, the precipitate is heated in an oven. (i) Complete the equation. Ca^{2+} +F⁻ \longrightarrow [2] (ii) Why is the volume of sodium fluoride solution double that of the calcium chloride solution?[1] (iii) Why is the mixture washed with distilled water? [1] (iv) Why is the solid heated? [1]

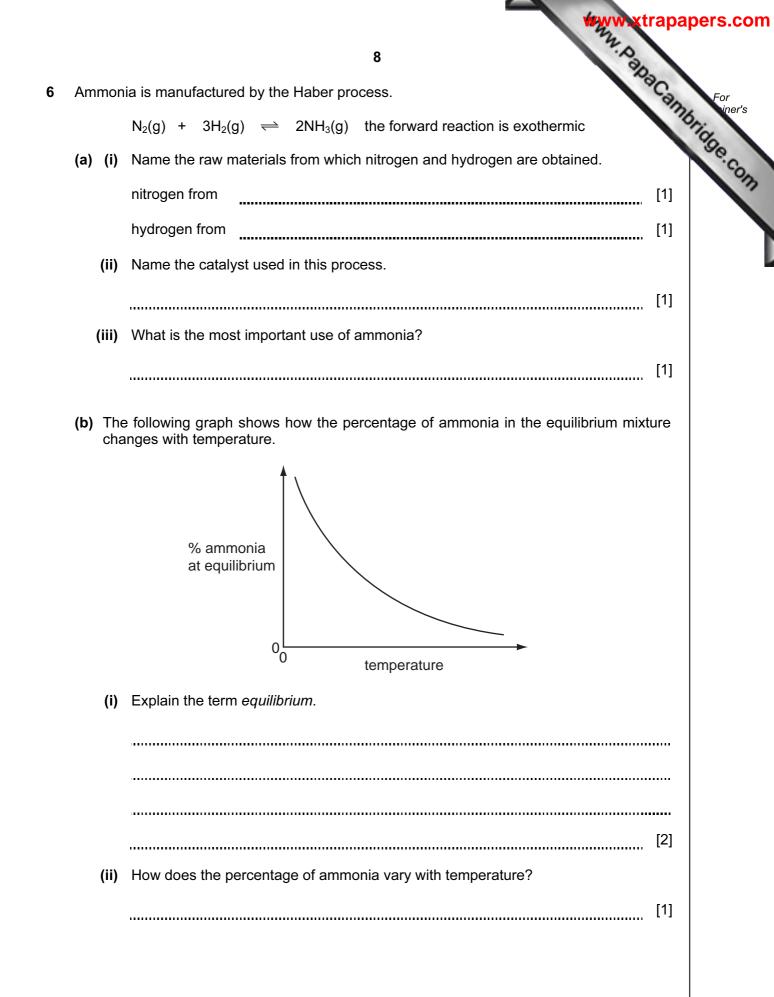

(b) The formulae of insoluble compounds can be found by precipitation reactions.

Www.papaCambridge.com To 12.0 cm³ of an aqueous solution of the nitrate of metal T was added 2.0 cm³ aqueous sodium phosphate, Na_3PO_4 . The concentration of both solutions was 1.00 mol/dm³. When the precipitate had settled, its height was measured.

The experiment was repeated using different volumes of the phosphate solution. The results are shown on the following graph.

the equine combined of the com 9 (c) (i) Sketch a graph which shows how the percentage of ammonia in the equil mixture varies with pressure. % ammonia at equilibrium 0 L 0 pressure [1] (ii) Explain why the graph has the shape shown. [2] [Total: 10]
