## Cambridge IGCSE $^{\text {TM }}$

## CAMBRIDGE INTERNATIONAL MATHEMATICS

0607/62
Paper 6 Investigation and Modelling (Extended)

You must answer on the question paper.
No additional materials are needed.

## INSTRUCTIONS

- Answer both part A (Questions 1 to 6 ) and part B (Questions 7 to 10 ).
- Use a black or dark blue pen. You may use an HB pencil for any diagrams or graphs.
- Write your name, centre number and candidate number in the boxes at the top of the page.
- Write your answer to each question in the space provided.
- Do not use an erasable pen or correction fluid.
- Do not write on any bar codes.
- You should use a graphic display calculator where appropriate.
- You may use tracing paper.
- You must show all necessary working clearly, including sketches, to gain full marks for correct methods.
- In this paper you will be awarded marks for providing full reasons, examples and steps in your working to communicate your mathematics clearly and precisely.

## INFORMATION

- The total mark for this paper is 60 .
- The number of marks for each question or part question is shown in brackets [ ].

## Answer both parts A and B.

## A INVESTIGATION (QUESTIONS 1 to 6)

## TWO-STEP SEQUENCES (30 marks)

You are advised to spend no more than 50 minutes on this part.
This investigation looks at two-step sequences.
These are sequences which use two steps to get from one term to the next.

The first term in every sequence is 1 .
The two steps are:

- multiply by a given number
- then add a given number.

1 In this question the two steps are:

- multiply by 2
- then add 1 .

1 st term $=1$
2 nd term $=1$ st term $\times 2+1=1 \times 2+1=3$
3rd term $=2$ nd term $\times 2+1=3 \times 2+1=7$
4th term $=3$ rd term $\times 2+1=7 \times 2+1=15$
(a) Work out the 5th term of this sequence.

$$
\begin{equation*}
1, \quad 3, \quad 7, \quad 15, \tag{2}
\end{equation*}
$$

(b) The $n$th term of another sequence is $2^{n}$.

Calculate the 2nd, 3rd and 4th terms of this sequence.

2,
(c) Look at your answers to part (a) and part (b).

Write down an expression, in terms of $n$, for the $n$th term of the sequence in part (a).

2 In this question the two steps are:

- multiply by 2
- then add 3.

The first term is 1 .
(a) Work out the 2 nd, 3 rd and 4 th terms of this sequence.

1,
(b) The $n$th term of this sequence is $a \times 2^{n}+b$.
(i) Substituting $n=1$, to get the first term of the sequence, gives the equation $2 a+b=1$.

Substitute another value for $n$ to make another equation in terms of $a$ and $b$.
(ii) Solve the simultaneous equations in part (i) to show that the $n$th term of the sequence is

$$
2 \times 2^{n}-3
$$

3 In this question the two steps are:

- multiply by 2
- then add 5.

The first term is 1 .
The expression for the $n$th term is $3 \times 2^{n}-5$.
Show that this expression gives the correct value for the 4th term of this sequence.

4 In this question the two steps are always:

- multiply by 2
- then add $k$.

The first term is 1 .
(a) Complete the table.

Use your answer to Question 1(c) and any patterns you notice.

| Steps to get the next term | Expression for the $n$th term |
| :---: | :---: |
| Multiply by 2, then add 1 |  |
| Multiply by 2, then add 3 | $2 \times 2^{n}-3$ |
| Multiply by 2, then add 5 | $3 \times 2^{n}-5$ |
| Multiply by 2, then add 7 | ................................. |
| Multiply by 2, then add | .... 9 |

(b) An expression for the $n$th term of this sequence is $a \times 2^{n}+b$.

Find expressions for $a$ and $b$ in terms of $k$.
Write down the expression for the $n$th term of the sequence.

$$
\begin{array}{r}
\qquad \begin{array}{r}
a=\ldots . . . . . . . . . . . . . . . . . . . . . . . . . . ~
\end{array} \\
b=\text {.............................. }
\end{array}
$$

(c) The 5th term of a sequence using the $n$th term in part (b) is 286 .

Complete the two steps.

- multiply by 2
- then add

5 In this question the two steps are:

- multiply by 3
- then add 2 .

The expression for the $n$th term is $\quad a \times 3^{(n-1)}+b$.
(a) The first term is 1 .
(i) Find the value of the second term of the sequence.
$\qquad$
(ii) Use the first two terms to write two equations in terms of $a$ and $b$.
$\qquad$
$\qquad$
(b) Find the value of $a$ and the value of $b$.

$$
\begin{align*}
& a=. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . ~
\end{align*}
$$

6 (a) Complete the table.
Use your answer to Question 5(b) and any patterns you notice.

| Steps to get the next term | Expression for the $n$th term |
| :---: | :---: |
| Multiply by 2, then add 1 | $2 \times 2^{(n-1)}-1$ |
| Multiply by 3 , then add 2 |  |
| Multiply by 4, then add 3 |  |
| Multiply by 5, then add 4 |  |
| Multiply by 6, then add 5 | $2 \times 6^{(n-1)}-1$ |

(b) For the sequence in the last row of the table, the first term has the value 1 and the second term has the value 11 .

Find which term has its value closest to 20000000 .

## B MODELLING (QUESTIONS 7 to 10)

## DRIVING TO MY PLACE OF WORK (30 marks)

You are advised to spend no more than 50 minutes on this part.
This task looks at a model for the time that I take to drive from my home to my place of work.
I live 20 km from my place of work.
When I leave my home at 7.00 am , I drive at an average speed of $50 \mathrm{~km} / \mathrm{h}$.
7 (a) Calculate the time, in minutes, to drive to work when I leave home at 7.00 am .
(b) The time that it takes me to drive to work is $m$ minutes.

Find, in its simplest form, a model for $m$ when my average speed is $v \mathrm{~km} / \mathrm{h}$.

8 When I leave home after 7.00 am , there is more traffic, and my average speed is less than $50 \mathrm{~km} / \mathrm{h}$.
My average speed decreases steadily by $1 \mathrm{~km} / \mathrm{h}$ for every 2 minutes after 7.00 am that I leave home. For example, when I leave at 6 minutes after 7.00 am , my average speed is $3 \mathrm{~km} / \mathrm{h}$ less, which is $47 \mathrm{~km} / \mathrm{h}$.
(a) I leave home at 7.40 am .
(i) Find my average speed.
(ii) Show that the time to drive to work is 40 minutes.
(b) I leave home $x$ minutes after 7.00 am .

Show that a model for the time, $T$ minutes, to drive to work is $T=\frac{2400}{100-x}$.
(c) Sketch the graph of the model $T=\frac{2400}{100-x}$ for $0 \leqslant x \leqslant 90$.

(d) I do not want to drive for more than 30 minutes.

Find the latest time that I should leave home.
(e) I must be at work by 9.00 am .

One day I oversleep and leave home at 8.35 am .
(i) Use the model to find how late I will be for work.

Give your answer in hours and minutes.
(ii) Make a statement about the suitability of the model.
$\qquad$

9 I leave home $x$ minutes after 7.00 am .
(a) Explain why a model for $A$, the number of minutes after 7.00 am when I arrive at work, is

$$
A=x+\frac{2400}{100-x} .
$$

$\qquad$
(b) I must be at work by 9.00 am , which is two hours after 7.00 am .

So my maximum value of $A$ is 120 .
(i) Show that, for this maximum value of $A, x$ is a solution to the equation

$$
x^{2}-220 x+9600=0 .
$$

(ii) Find this value of $x$.
(iii) Find the latest time that I can leave home to arrive at work on time.

10 I move to a new home and now live $d \mathrm{~km}$ from my work.
When I leave my new home at 7.00 am , my average speed is $v \mathrm{~km} / \mathrm{h}$.
As before, my average speed decreases steadily by $1 \mathrm{~km} / \mathrm{h}$ for every 2 minutes after 7.00 am that I leave home.
(a) I leave my new home $x$ minutes after 7.00 am .

Show that a model for the time, $T$ minutes, to drive to work is $T=\frac{120 d}{2 v-x}$.
(b) I want to leave my new home at 7.30 am and arrive at work at 9.00 am .

Find a model for $v$ in terms of $d$.
