Paper 5 Practical Test

October/November 2008

1 hour 30 minutes

Candidates answer on the Question Paper.

Additional Materials:

As listed in Instructions to Supervisors.

# **READ THESE INSTRUCTIONS FIRST**

Write your Centre number, candidate number and name on all the work you hand in.

Write in dark blue or black pen.

You may use a pencil for any diagrams, graphs or rough working.

Do not use staples, paper clips, highlighters, glue or correction fluid.

DO **NOT** WRITE IN ANY BARCODES

Answer all questions.

Chemistry practical notes for this paper are printed on page 12.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [ ] at the end of each question or part question.

| For Examiner's Use |  |  |  |  |
|--------------------|--|--|--|--|
| 1                  |  |  |  |  |
| 2                  |  |  |  |  |
| Total              |  |  |  |  |

This document consists of 8 printed pages and 4 blank pages.

**BLANK PAGE** 

1 You are going to make various measurements with a spring that will enable determine a value for the acceleration of free fall, g.

Set up the apparatus as shown in Fig. 1.1. Make sure that there is sufficient room below the spring to allow for stretching and that the rule is clamped with the zero at the bottom.

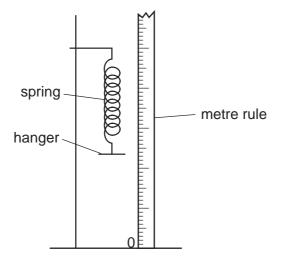

Fig. 1.1

- (a) Read and record the position of the bottom of the hanger.
  - Add a 200 g mass to the hanger.
  - Using the metre rule, read and record the new position of the bottom of the hanger.
  - Calculate the extension, **E**, which is the difference between the **two** values.

| position of hanger with no mass added | = | mm |
|---------------------------------------|---|----|
| position of hanger with 200 g mass    | = | mm |
| extension, <b>E</b>                   | = | mm |

- (b) Replace the 200 g mass with 150 g.
  - Remove the metre rule
  - Pull down the hanger about 20 mm and release it to allow the spring to gent oscillate in a vertical direction.
  - Time 20 oscillations and record this time in Fig. 1.3.

Fig. 1.2 may help you to understand what is meant by one complete oscillation.

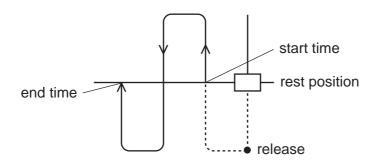

Fig. 1.2

(c) You are now going to repeat the timing of 20 oscillations three more times using different masses. Choose a range of masses in the region 150 g to 300 g. Record the times in Fig. 1.3.

|        |                            | T/s                    | <b>T</b> <sup>2</sup> /s <sup>2</sup> |
|--------|----------------------------|------------------------|---------------------------------------|
| mass/g | time for 20 oscillations/s | time for 1 oscillation |                                       |
| 150    |                            |                        |                                       |
|        |                            |                        |                                       |
|        |                            |                        |                                       |
|        |                            |                        |                                       |
|        |                            |                        |                                       |

Fig. 1.3 [4]

(d) Complete Fig. 1.3 by calculating the time, T, for 1 oscillation. This is done by dividing the time for 20 oscillations by 20. Then square each value to calculate  $T^2$  to two decimal places.

(e) Plot a graph of T² (vertical axis) against the mass. Draw the best straight line through your points.

Use the graph to measure the gradient of the line. Show clearly on your graph how you did this.

gradient = 
$$s^2/g$$
 [2]

(g) Use the gradient from (f) and the extension, E, from (a) to find the value of g, using the formula,

$$g = E \times 0.0002$$
  
gradient
