

Candidates answer on the Question paper

No Additional Materials are required.

READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name on all the work you hand in. Write in dark blue or black pen.

You may use a soft pencil for any diagrams, graphs, tables or rough working.

Do not use staples, paper clips, highlighters, glue or correction fluid.

DO NOT WRITE IN ANY BARCODES.

Answer all questions.

 ∞

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [] at the end of each question or part question.

Www.papacambridge.com 1 A student was investigating the conditions needed for photosynthesis. He variegated plant (one with green and white leaves). An example of a leaf is show Fig. 1.1.

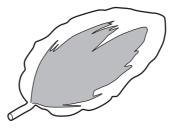

Fig. 1.1

The plant had been left in the dark before the experiment. The student selected three leaves and made a drawing of each so that he could remember the areas containing chlorophyll. He then set up the apparatus shown in Fig. 1.2.

After 24 hours in daylight he removed the leaves and tested them for the presence of starch.

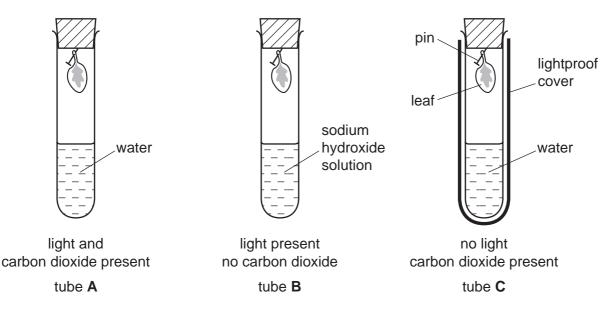

Fig. 1.2

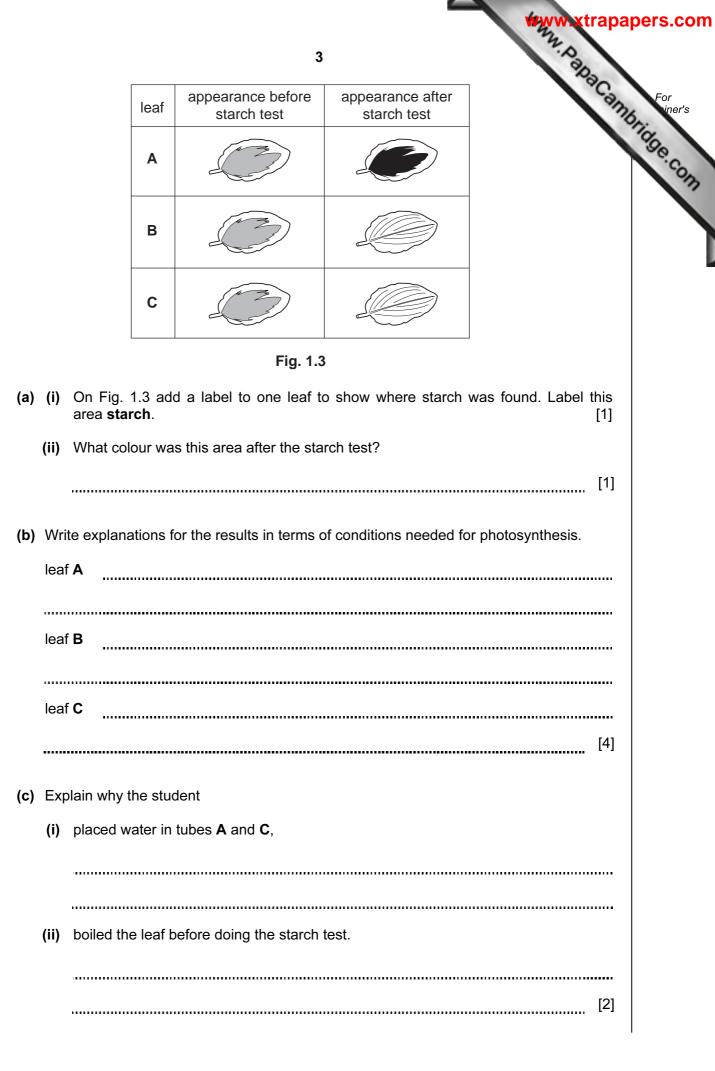

He tested all three leaves for the presence of starch using the following method.

- He placed the leaf in a beaker of boiling water for one minute. •
- He then took it out and put it into a test-tube. •
- Then he added alcohol to the leaf in the tube and placed the tube into the beaker of hot • water until the chlorophyll was removed from the leaf.
- He poured the alcohol out of the tube and rinsed the leaf using cold water. .
- Then he spread the leaf out on a white tile, covered it with iodine solution and waited for any colour change to develop.

His results are shown in Fig. 1.3.

2 A student has found three automobile lamps at the scrap yard. The student finds some printing on the lamps, and copies this into Fig. 2.1.

lamp	what is printe	ed on the lamp
1	24 V	36 W
2	12 V	18 W
3	6 V	18 W

He wants to compare the resistances of the three lamps using the circuit shown in Fig. 2.2.

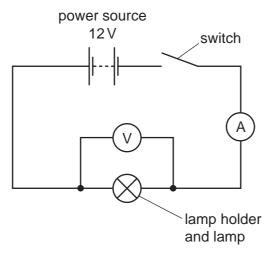

Fig. 2.2

- The student inserts lamp **1** into the lampholder.
- He closes the switch.
- He reads the voltmeter and ammeter and records the readings in Fig. 2.3.
- He repeats the experiment using lamp **2**.

lamp	voltmeter reading/V	ammeter reading/A	brightness of the lamp
1	11.9	0.72	dim
2			bright

Fig. 2.3

For iner's

For iner's 5 (a) The ammeter and voltmeter readings for lamp 2 are shown in Fig. 2.4. Record the readings in Fig. 2.3. 1.0 10 C 0 Fig. 2.4 (b) The student wants to use the equation V = IR to find the resistance of the lamps 1 and 2. (i) Rearrange the equation V = IR. R = _____ [1] (ii) Calculate the resistance of lamp 1 using the data from Fig. 2.3. resistance of lamp **1** = _____ ohms [1] (iii) Calculate the resistance of lamp 2 using the data from Fig. 2.3. resistance of lamp 2 = _____ ohms [1]

		www.xtrapa	pers.com
		2	
(c)	He	6 e student repeats the experiment with lamp 3 . fixes the lamp in the lampholder and closes the switch. The lamp glows bright, hort time and then the ammeter reading falls to 0.	For iner's
		e data from Fig. 2.1 and 2.3 to help you to explain what happened to lamp 3 when student used it in the circuit.	Se.com
		[2]	-
(d)	(i)	Use data from Fig. 2.1 and Fig. 2.3 to suggest a reason why lamp 1 gave only a dim light.	
		[1]	
	(ii)	Calculate the power in watts of lamp 2 , using data from Fig. 2.3.	

power of lamp 2 = _____watts [2]

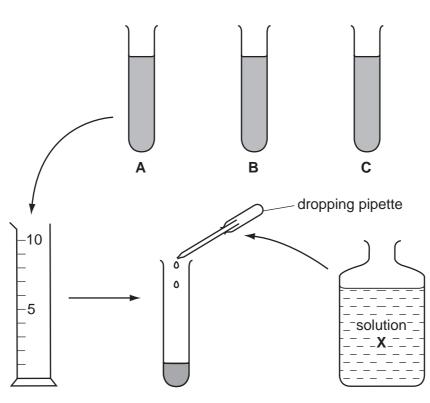

BLANK PAGE

Please turn over for Question 3.

Www.PapaCambridge.com 3 Potassium manganate(VII) (potassium permanganate) is a dark crystalline substant solution in water is dark purple. Potassium permanganate solution reacts with solution X. When the reaction is complete the purple colour disappears.

A student uses a dropping pipette and solution **X** to find out which one of three potassium permanganate solutions, A, B or C is the most concentrated. The apparatus is shown in Fig. 3.1.

potassium permanganate solutions

Procedure

- She measures out some of solution **A** and pours it into a test-tube. •
- She fills the dropping pipette with solution **X**. •
- She adds solution **X** drop by drop to solution **A**, counting the drops, until the reaction • has finished.
- She records the number of drops added in Fig. 3.2.
- She repeats the experiment using solutions **B** and **C**.

solution	number of drops used
А	15
В	24
С	18

		www.xtr	apapers.com
		9	
(a)	(i)	9 What must the student do to make a fair comparison between the three st A, B and C?	For iner's [1]
	(ii)	How will she make sure that all the reacting particles come into contact with ea other when the drops are added ?	ch Conn
			[1]
	(iii)	How will she know when to stop adding the drops of solution X ?	
			[1]
	(iv)	Which is the most concentrated of the solutions, A, B or C?	
			[1]
(b)		ggest a way, using the apparatus in Fig. 3.1, of finding the accurate volume of o p of liquid from the teat pipette.	ne
			[2]
	•••••		

(c) The student carries out tests on solution X. She writes the results in Fig. 3.3.

Complete Fig. 3.3.

	test	observation		conclusion
(i)	To 2 cm ³ of solution X , add a few drops of dilute hydrochloric acid followed by aqueous barium chloride.		[1]	solution X contains sulfate ions
(ii)	To 2 cm ³ of solution X , add aqueous sodium hydroxide until no further change occurs.		[1]	solution X contains iron(II) ions

4 African elephants have big ears to help with temperature control.

Www.PapaCambridge.com A student set up an experiment as a model to investigate the effect of large ears. She had two insulated beakers as shown in Fig. 4.1. Both beakers had insulated lids. Beaker B also had two model 'ears' made from copper. The student filled both beakers with hot water, then took the temperatures of the water every two minutes. The apparatus is shown in Fig. 4.1.

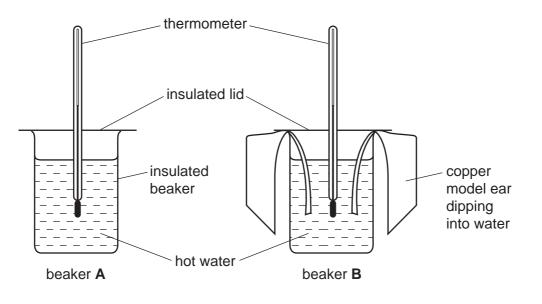

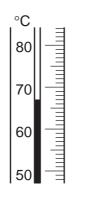

Fig. 4.1

The results are shown in Fig. 4.3.

(a) Read the thermometers in Fig. 4.2 and enter the readings in the correct places in Fig. 4.3. [2]

°C

temperature of beaker A at 18 mins

temperature of beaker **B** at 6 mins

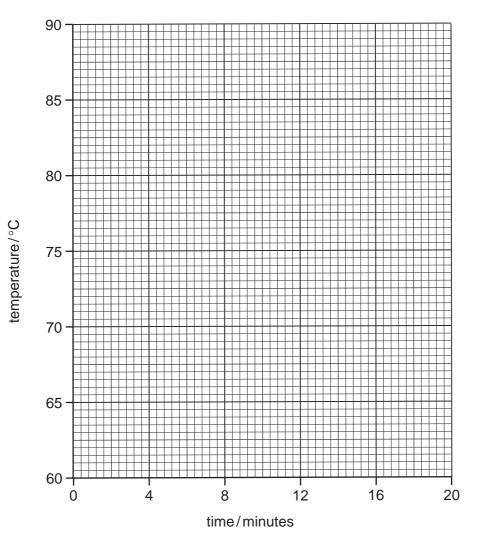

Fig. 4.2

- He places the glass block on a sheet of paper on top of a flat piece of soft wood. •
- He draws a line on the paper all round the glass block. •

5

- He places two upright pins, **A** and **B**, in a line, at an angle to the side of the block. •
- Then he looks through the glass block at the two pins. •
- When he sees the two pins **A** and **B** in line, he places pins **C** and **D** on his side of the • block, in line with pins **A** and **B**.
- He removes the glass block and draws the path of a ray of light through the block.

- (ii) Draw the normal where the incident ray enters the glass block. See Fig. 5.1. [1]
- (iii) On Fig. 5.2, label i, the angle of incidence, and **r**, the angle of refraction. [1]
- (iv) On Fig. 5.2, measure i, the angle of incidence and r, the angle of refraction to the nearest degree. Record them in the first line of Fig. 5.3, on page 16. [2]

The student repeats the experiment, changing the angle of incidence each time, to give four more sets of readings. He records them in Fig. 5.3.

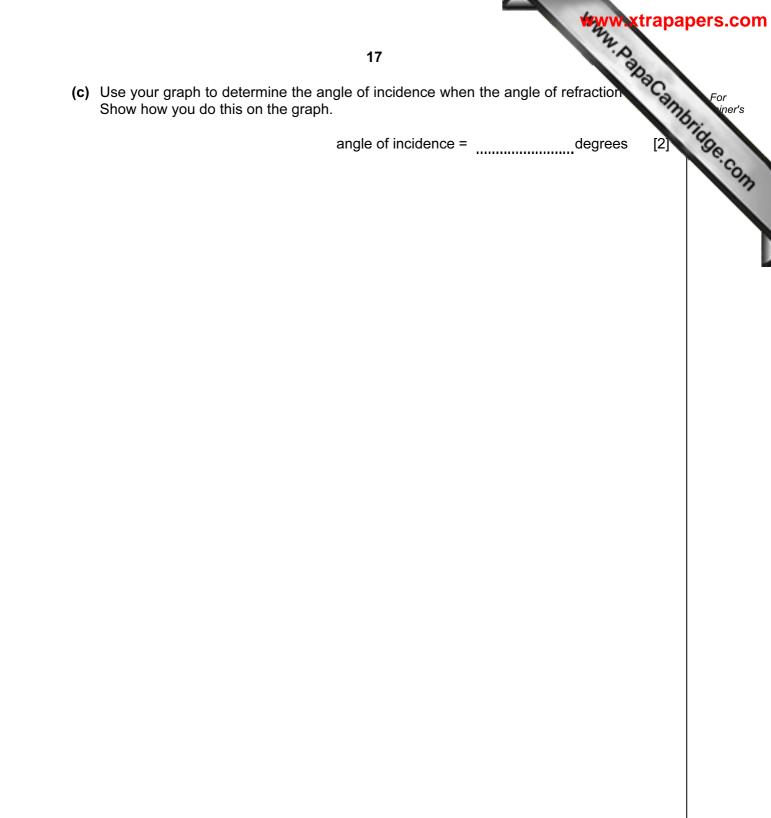

1	6 angle of refraction r/degrees
angle of incidence i/degrees	angle of refraction r /degrees
38	24
46	28
54	32
63	35

[3]

(b) On the graph grid provided, plot a graph of i (vertical axis) against r. Draw a smooth curve. Do not try to extend the line beyond the plotted points.
